

Modules and Dependencies

Foundation document | Version 0.1 | 07 August 2026

Core platform

Identity and Tenant Settings manage company profile, branches, users, roles, access, and policies. Module Management controls tenant and user eligibility. Notifications delivers in-app, push, email, SMS, or WhatsApp through configured providers. Audit and Reporting provide evidence and exports.

V1 modules

Employee Management: profiles, employment information, reporting manager, documents, status, and timeline. Attendance: check-in/out, time/location capture, shifts, exceptions, calendar, late rules, and admin review. Leave: request, approve/reject, half-day/emergency leave, and payroll effect. Payroll: salary structures, period calculations, adjustments, review, and payslips. Tasks: assignments, priority, due date/time optional, notes, files, proof, status, and recurring templates. Daily Reporting: summaries of attendance, task status, exceptions, and configured delivery. Performance and Leaderboards: attendance and task-derived indicators only, with transparent definitions.

Optional V1 modules

Expenses, Assets, Announcements, Approvals, and GPS Tracking may be enabled per tenant only when their detailed rules are approved. "GPS Tracking" refers to event-based attendance/task proof, not continuous covert tracking by default.

Dependency rules

Payroll requires Employee Management and Attendance; it may consume approved Leave. Leave requires Employee Management. Tasks requires Employee Management. Performance requires Attendance or Tasks. Leaderboards require their source module and a published scoring definition. Daily Reporting depends on the modules included in the selected summary. Disabling a required module must show impact and block or require a safe migration decision.

Excluded from V1

Visitor Register, biometric hardware sync, face recognition, QR/Rfid attendance, bank transfer generation, Tally/Busy/Zoho integrations, CRM, inventory, and continuous location tracking.

Give this to Claude

Use these modules and dependencies to create the information architecture. Show only enabled modules in a tenant's navigation. Before designing an optional module, ask whether its detailed requirement document is approved.
