

Product Constitution

Foundation document | Version 0.1 | 07 August 2026

1. Configuration before custom code

Tenant policies, modules, features, roles, shifts, late rules, and notification preferences must be data-driven. A customer-specific rule must not require a separate codebase.

2. Tenant isolation is mandatory

Every tenant-owned record, query, file, notification, and report is scoped to one tenant. Cross-tenant access is permitted only through explicit platform-super-admin controls and is audited.

3. Explicit authority

No leave, correction, payroll change, task closure, or policy override is silently approved. The acting person, decision, timestamp, reason, and before/after values are preserved.

4. Practical mobile use wins

Employees must be able to check in, see tasks, submit proof, request leave, and read notices with minimal taps on a phone. Desktop enhances administration; it does not define the product.

5. Feature flags are enforced everywhere

When a module or feature is disabled for a tenant or user, it is absent from navigation, denied by APIs, excluded from jobs/notifications, and recorded in configuration. Hiding a menu item alone is not sufficient.

6. Payroll needs traceability

Salary output must show inputs, policy versions, adjustments, approvals, and the calculation period. Calculations cannot be overwritten without an auditable adjustment path.

7. Privacy and consent

Location, selfie, documents, and payroll data are sensitive. Capture only approved data, explain the purpose, limit access, retain it only as required, and provide export/deletion workflows subject to legal obligations.

8. Change control

A new feature enters the Product Bible, Modules, Feature Flags, roles/permissions, UI design, and tests before it enters code. Material decisions are logged.

Give this to Claude

Use these eight rules as hard constraints. If a requested design conflicts with one, flag the conflict and propose an approved-document change instead of silently bypassing it.
