Product statement

Sudarshan Task Force (STF) is a configurable workforce operating system for SMEs. It helps owners know who is working, where they are, what was assigned, what was completed, and what salary is due.

Primary users

Platform Super Admin operates the SaaS. Tenant Owner controls a company. Admin and HR run people operations. Manager and Team Leader assign and review work. Employees check in, receive tasks, request leave, submit proof, and view their own records.

V1 jobs to be done

An employee checks in or out with a large mobile action and location/time capture. An admin reviews exceptions and authorizes leave. Payroll uses approved leave, attendance, late policy, half-days, advances, incentives, and deductions. A supervisor assigns tasks with an optional time frame and receives proof. The platform sends a daily summary link by configured channels to the Super Admin.

Product boundaries

STF is not an ERP, accounting ledger, visitor register, biometric system, or mandatory holiday/earned-leave system in V1. Those ideas remain in a future backlog. Legal payroll calculations and statutory compliance must be configured and reviewed by a qualified local professional before production use.

Core concepts

Tenant: one customer company with isolated data. User: login identity. Employee: workforce profile linked to a user where relevant. Module: large capability such as Payroll. Feature: a controlled capability inside a module. Permission: action a role may perform. Policy: tenant-configured business rule. Approval: recorded decision and reason. Audit event: immutable who/what/when record.

Non-negotiable experience

Mobile first, fast for non-technical workers, clear language, large primary actions, low data entry, explicit statuses, safe approval trails, and no hidden calculations. All sensitive actions must show their effect before confirmation.

Success measures

Daily attendance completion, on-time checkout rate, task completion rate, exception resolution time, payroll review accuracy, and active use by managers and employees.

Give this to Claude

Design STF as a practical mobile-first SME SaaS. Prioritize the V1 jobs above, make status and approvals obvious, and keep future modules out of V1 screens unless shown as disabled configuration.
